The transmission of an image requires...

- **Compression**: Reduces the amount of data needed to represent the image, making it easier to transmit.
- **Decompression**: Recovers the original image from the compressed data.

The process involves:
1. **Encoding**: Converts the image into a digital format that can be transmitted.
2. **Transmission**: Sends the encoded data over a network or other communication channel.
3. **Decoding**: Recovers the original image from the transmitted data.

This is crucial for applications like digital photography, video streaming, and multimedia services.

[Text]

[Image: Document page with text]
The image contains text that appears to be related to a legal or technical document. The text is dense and not easily readable due to the quality of the image. It seems to be discussing specific regulations, codes, or standards, possibly related to engineering or legal frameworks. Due to the nature of the text, it is not possible to provide a meaningful translation or summary without clearer visibility of the document content.
